Abstract

Black cultural memory in the United States is not primarily threatened by a lack of collecting, but by everything that happens after collecting. This paper distills CTL-DR-PRESERVE-001, a six-track synthesis covering 84 canonical collections, 119 entities, 70 timeline events, 78 relationships, and 304 sources. The findings locate the breakage: cataloging backlogs make saved collections unfindable and undefendable; ownership changes — bankruptcy sales, corporate pivots — are the fastest-acting destroyer of Black archives; the private collector's mortality is the most time-sensitive risk; platform-hosted memory is not memory; and rights uncertainty silently blocks digitization where materials are physically safe. A ten-stage memory-chain audit shows abundance at the start and breakage in the middle: cataloging the worst-supported stage by hard evidence, discoverability the thinnest overall. The paper also presents a transparent triage framework — Risk × Significance × Uniqueness, gated by Feasibility — worked through eight examples, and an honest account of what could not be resolved, including the highest-value unresolved lead: the records of A.A. Rayner & Sons, the Chicago funeral home that handled Emmett Till's arrangements.

---

1. Introduction

In September 2026, BET Digital permanently deleted its entire written news archive. Years of Black journalism vanished in a corporate "video-first pivot" under Paramount — no warning given, no migration offered. The writers lost the only

copies of their work they had. The material had existed. It had been collected, published, read, cited. And then, with a strategy memo, it was gone.

That deletion is the emergency in miniature. The threat to Black cultural memory in America is not that nobody is recording it. Recording happens in abundance — in basements and attics, in church archives, in photographers' darkrooms, in radio-station libraries, on phones, on servers. The threat is what happens next: the uncataloged backlog that makes a saved collection unfindable; the bankruptcy auction that puts a century of images on the block; the garage fire that takes a life's-work of negatives; the founder who dies without a succession plan; the platform that changes its business model and takes the archive with it; the expired music license that pulls a landmark documentary out of circulation for a decade.

This paper is a distillation of CTL-DR-PRESERVE-001, a research synthesis conducted across six tracks: institutional repositories, community-held and private collections, digital collections and platforms, a 35-case risk register, a preservation priority framework, and a ten-stage memory-chain analysis. The tracks were researched independently on the public web in late September 2026, then synthesized with mandatory cross-track deduplication. The canonical corpus that resulted comprises 84 collections, 119 entities, 70 timeline events, 78 relationships, and 304 sources.

The emergency, as the evidence shows it, is not mysterious. It is a triage problem: which at-risk collections should scarce preservation resources — money, archivist hours, cold storage, grant attention — reach first? This paper presents the diagnosis, the triage framework, and a deliberately honest account of the limits of what the research could establish. Every claim carries an evidence grade, and claims that did not survive an independent red-team audit were downgraded or dropped. That honesty is part of the method, and this paper tries to hold it all the way through.

One point of orientation before the evidence: the corpus is Chicago-anchored by design, and national in coverage only where the public record documented it. It is not a census of all Black archives. What follows describes the documented fraction of Black memory. The undocumented fraction — as the research itself records — is the actual emergency.

2. Methodology

2.1 The corpus

Six research tracks were pursued independently, then merged. The institutional track mapped university, museum, public-library, and federal holdings of Black cultural material. The community track mapped family-held, church-held, and privately collected holdings. The digital track mapped platforms, creator-led archives, and the infrastructure of online Black memory. The risk track built a 35-case register across 14 risk types. The framework track produced a prioritization method with worked examples. The memory-chain track audited ten stages of a collection's life, from creation to transmission.

Deduplication reduced 91 track-level records to 84 canonical collections: 32 institutional-origin, 29 community-origin, 21 digital-origin, 5 framework-derived, and 4 risk-derived. Six merges absorbed 13 track records into 6 canonical records — the Johnson Publishing Company archive being the largest, drawing on institutional, community, and digital track records. Where merged tracks disagreed on a grade, the weaker grade was kept; in practice no merge triggered that rule. Where sources conflicted on point values — the JPC archive's 4 million versus 4.5 million images; the Harsh Collection's 70,000 versus 80,000-plus books; Moorland-Spingarn's 17,000 versus 18,000-plus linear feet; Schomburg's 10 million versus 11 million items; Teenie Harris's 70,000-plus versus roughly 80,000 negatives — the documented range is preserved and the conflict noted. Nothing was averaged away.

The 119 entity records in the corpus are dominated by collection records (40) and event records (33), with custodians (17), risks (14), concepts (10), and persons (5) making up the rest (Figure 1).

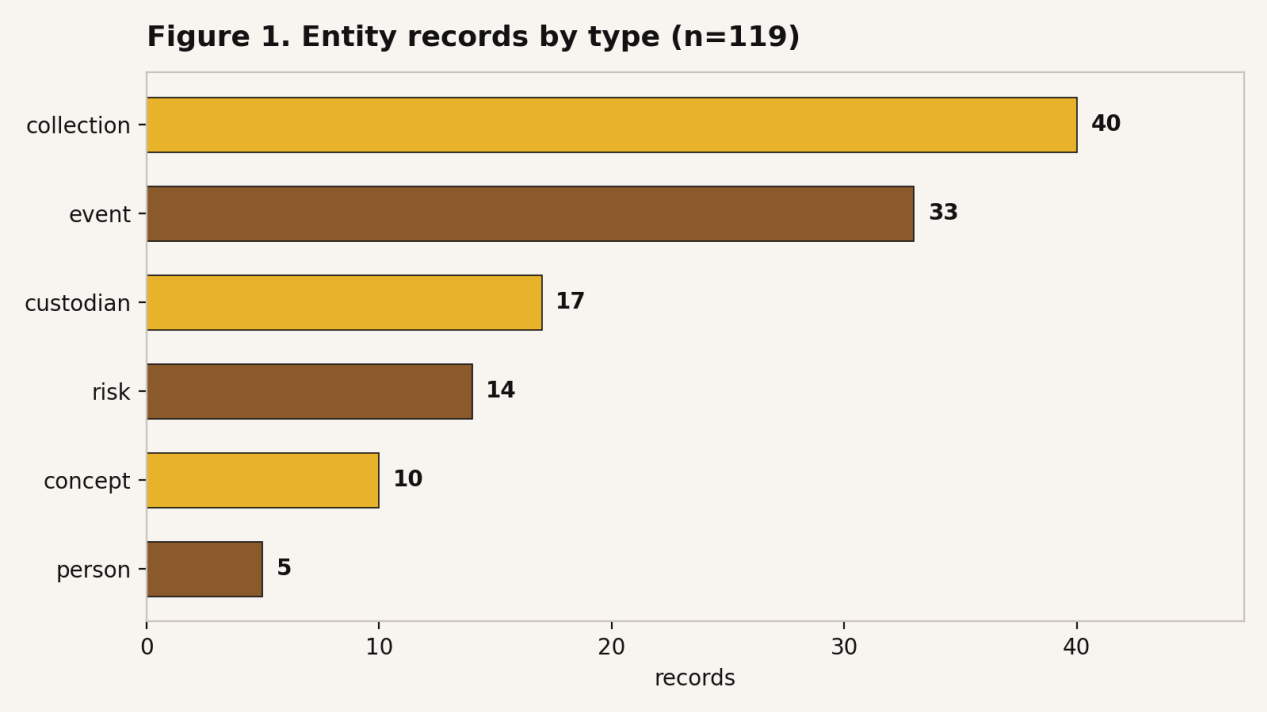

Figure 1. Entity records by type (n=119): collection 40, event 33, custodian 17, risk 14, concept 10, person 5.
Source: Computed from CTL-DR-PRESERVE-001/entities.json (entity records).

2.2 The evidence grades

Every substantive claim in the synthesis carries one of five grades, and this paper inherits them. The grades are a real methodological feature, not window dressing:

- **Verified** — corroborated by two or more independent sources, or resting on institutional or primary evidence: published finding aids, legal filings, institutional statements, the custodian's own published data. This is the publication-grade standard.
- **Supported** — reputable secondary reporting supports the claim, but it does not meet the Verified threshold: a single strong secondary account, or an institutional self-report standing alone on a non-controversial fact. Credible, but one leg short of Verified.
- **Provisional** — single-source, inferential, or anecdotal. A Provisional claim is an invitation to verify, not a finding. In this paper every Provisional claim is labeled as such.
- **Disputed** — sources conflict; both are preserved and the conflict is stated rather than resolved.

- **Unresolved** — not knowable from public sources. Recorded as a gap, never as an assumption.

Seventy timeline events are graded Verified throughout. Seventy-seven of 78 relationships are Verified; one — an edge resting on a citation stub — is Provisional. Twenty-eight collection records are Verified at record level and two Provisional; the remaining 54 are honestly recorded as not graded at record level, because the track files graded substantive claims rather than collection records, and the project chose disclosure over backfilling.

Figure 2 summarizes the verification status of the 142 claims graded across the entity records: 100 Verified, 33 Provisional, 7 Unresolved, and 2 Disputed.

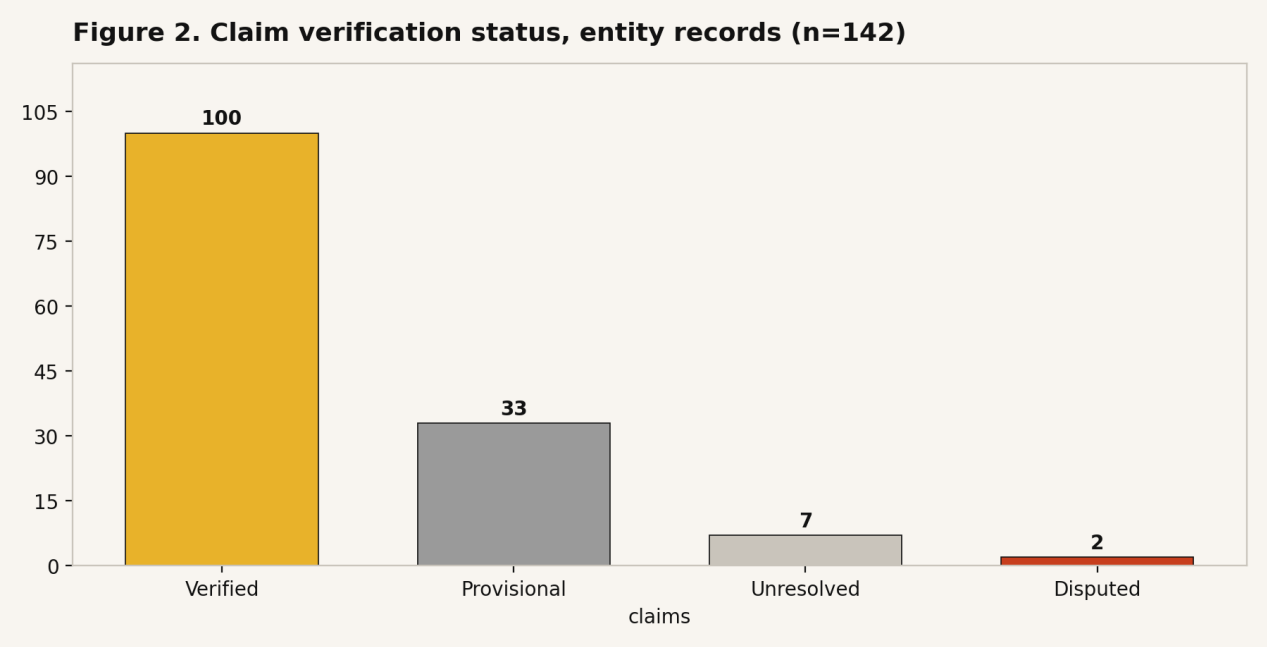

Figure 2. Claim verification status across entity records (n=142): Verified 100, Provisional 33, Unresolved 7, Disputed 2.
Source: Computed from the verification_status field of claims in CTL-DR-PRESERVE-001/entities.json.

2.3 The red-team pass

After synthesis, an independent red-team worker audited the package for honesty — not by redoing the research, but by checking whether the package met its own standards. Twelve issues were found, including grade inflation in claims marked Verified on single sources, the omission of rights uncertainty from the brief's findings despite its presence at record level, savior-leaning phrasing that positioned

institutions as the default interveners in community custody, and arithmetic contradictions in track-count tables.

All twelve issues were remediated. The full re-audit of Verified-but-not-primary claims produced **23 claim downgrades** — seventeen to Provisional, two to Disputed (claims about Universal Music vault-fire losses, where the company's public statements contradict an internal loss memo), plus four single-source claims caught in the first sample — and one relationship downgrade to Provisional. The brief's executive framing was rewritten to credit communities, families, and coalitions for the rescues that predated any framework. Findings 1, 3, and 4 of this paper carry the hedges the re-audit required.

2.4 Constraints and skew

The privacy constraint is absolute: no private street addresses, no precise home or storage locations of private collections, no sensitive personal information. All locations are normalized to city or institution level; a documented public-landmark exception covers the published street addresses of public museums. Family collections, private collectors, and funeral-home records are described at aggregate level only. An automated privacy scan of the final records returned zero flags.

Two disclosures about coverage. First, roughly 62 percent of the 84 mapped collections are held by universities, major museums, public libraries, or federal institutions — a method-induced skew of web-visible sources. Community-controlled holdings are the known thin edge of this corpus, not the thin edge of Black memory itself; the community track states plainly that the most important collections are the ones no search can find. Second, about 33 of the 84 collections sit in Chicago. The corpus is Chicago-anchored by design, and says so everywhere it matters.

3. Findings

Figure 3 shows the decade distribution of the corpus's 70 timeline events: sparse coverage from the 1910s through the 1990s, then 11 events in the 2000s, 18 in the 2010s, and 23 in the 2020s. All 70 are graded Verified — the same skew of the web-visible source base that Section 4 names as a coverage limit.

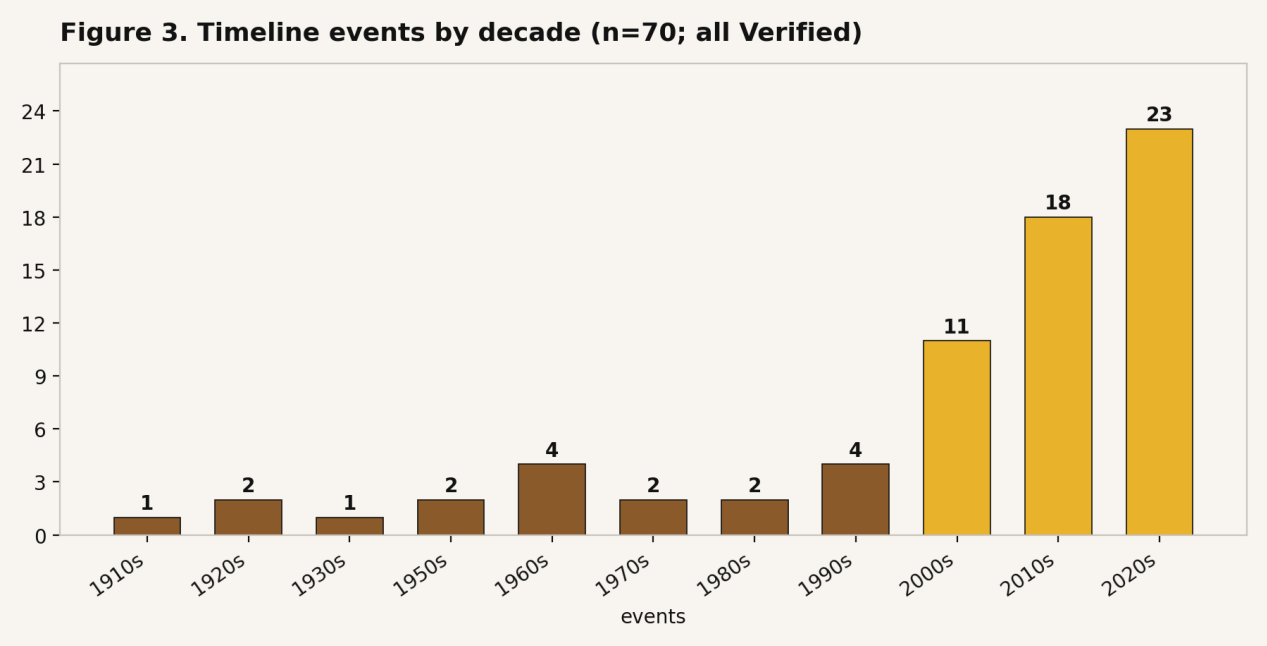

Figure 3. Timeline events by decade (n=70; all 70 Verified).
Source: Computed from CTL-DR-PRESERVE-001/timeline.json (date_or_era field).

3.1 Cataloging is where the chain breaks worst. (Verified; current-state portion of the AFRO account Provisional)

The single highest-leverage intervention point in the entire system is not acquisition, not digitization, not a new portal. It is cataloging. Consider the AFRO-American Newspapers chain archive: roughly three million photographs, 130 years of a family-owned Black press, sitting in inaccessible state storage — with approximately five percent processed since October 2022. The current-state portion of that account is Provisional, pending re-audit, but the direction of the evidence is unambiguous. The Black Metropolis Research Consortium's 2009–2011 survey found Chicago's Black collections systematically unprocessed or underprocessed. The Baltimore Collection arrived as 53 "found objects" — no photographers, no sitters, no dates, no provenance. These are not edge cases. They are the pattern.

An uncataloged collection cannot be found, used, cited in a grant application, or defended in a budget fight. It is saved and simultaneously lost — present in a room, absent from the record. The BMRC's Color Curtain Processing Project showed the remedy at work: a CLIR-funded effort that processed roughly 130 collections and trained a generation of archivists in the process. The ten-stage memory-chain audit confirms the diagnosis from the other end: CATALOGED is the worst-supported stage by hard evidence across the whole corpus, and DISCOVERABLE — the stage cataloging feeds — is the thinnest-evidenced stage overall.

3.2 Ownership change is the fastest destroyer. (Verified)

Collections that are safe today can be on the auction block tomorrow, and the mechanism is almost always a change in who holds the keys. The Johnson Publishing Company archive — the photographic and business archive of Ebony and Jet, four million-plus images documenting Black American life across the twentieth century — reached a bankruptcy auction in July 2019. It was saved only because a four-foundation consortium (Ford, Getty, MacArthur, Mellon) assembled in a two-day diligence sprint and paid just under $30 million, with the archive destined for the Getty Research Institute and the Smithsonian's National Museum of African American History and Culture. Ownership has since transferred formally to those institutions, with a $30 million digitization commitment from Getty. The rescue is real, and it is also the exception that maps the rule: the archive came within one bidding cycle of dispersal into private hands.

BET Digital needed no auction. In September 2026 the company permanently deleted its entire written news archive as a "video-first pivot" under Paramount — no warning, writers losing the only copies of their work. MTV News's archive was wiped in 2024. Vee-Jay Records' masters passed through a 1966 bankruptcy into undocumented custody, and more than 5,000 master tapes remain unlocated today. The finding holds across sectors and decades: corporate-held Black memory is revocable memory. What a balance sheet can move, a strategy memo can delete.

3.3 The collector's mortality is the ticking clock. (Verified; the Simmons-fire account and the Carter/Black disposition claims Provisional)

Private collectors are the most time-sensitive risk class in the corpus, because the threat is actuarial. Estates disperse, garages burn, hard drives die — and they do so most often with no succession plan and no institutional relationship in place. In 2025, photographer John Simmons's life's-work negatives burned in a friend's garage during a move. That account is Provisional — single-source reporting — but it sits inside a fully Verified pattern. Teenie Harris's roughly 80,000 negatives survived only because the Carnegie Museum of Art bought them from the family in 2001, three years after his death. Octogenarian photojournalists Ovie Carter and Bob Black hold personal negative archives with no documented succession; those disposition claims are Provisional precisely because the record is silent, which is itself the point. When a 37,000-item collection does find a home — John Duke Kisch's Separate Cinema Archive, acquired by the Lucas Museum in 2025 — it works because someone acted before the worst stage. Every private collection

without a succession plan is a countdown, and the norm for succession is family and community. External custody is one option among others, never the default.

3.4 Platform memory is not memory. (Verified; the Black Archives Co reach figure Provisional)

MySpace lost all 2003–2015 uploads — roughly 50 million songs — in its 2019 server migration. Whether the deletion was accident or cost-cutting is Disputed; that the loss happened is not. (The Internet Archive later uploaded 450,000 songs collected before the migration, which measures the scale of the gap as much as it closes it.) Vine shut down in 2017. Tumblr purged in 2018. Twitter's 2023 API paywall broke the dominant research infrastructure for Black digital expression, and Pew measured the decay: 18 percent of 2020–2022 #BlackLivesMatter tweets were already gone by 2023. Black Archives Co — a thirteen-year archive of Black life — lives on Instagram with no documented institutional backup; its reach figures are self-reported and Provisional.

The pattern is structural. Platforms are businesses, and businesses are permitted to change their minds. Digitization on someone else's server is distribution, not preservation. The Internet Archive is the only systemic backstop in this corpus, and it is a nonprofit. When the corpus's rescue cases are examined, the same institution recurs: the Archive captured the BET articles after the deletion, holds the WVON airchecks, anchors the dark-archive logic. A preservation strategy that does not include a copy outside the platform is a strategy of hope.

3.5 Rescue happens at the decision point — usually by communities, not frameworks. (Verified)

The corpus contains real rescues, and they share a shape. The JPC archive, rescued at its 2019 auction. The Illinois burial records: 140,000-plus records rescued in 2022 by a ten-person community team working with the Illinois Comptroller and the Bronzeville Historical Society. The King and King funeral-home records, recovered in September 2024 before demolition. The DJ Screw Collection: donated by his father beginning in 2011, now cataloged and partially digitized at the University of Houston Libraries. The Mother Bethel AME records: moved in 2013 to the Presbyterian Historical Society for climate-controlled storage, digitized by 2021 on a Pennsylvania Abolition Society grant.

Every one of these happened because someone acted at the decision point — before the auction gavel, before the demolition, before the tape binder failed — and the

actors were communities, families, and coalitions. The priority framework presented in section 3.7 exists to manufacture more such decision points; it cannot and does not claim credit for rescues that predate it. That distinction matters. The rescues prove that decisive action works. They do not prove that triage tools work. Validation of the framework requires prospective use — rating a collection now, acting on the rating, and watching what happens.

3.6 Rights uncertainty is the silent blocker. (Verified)

Thirty-three of the 84 mapped collections carry undocumented rights status, and rights uncertainty blocks digitization and reuse even where materials are physically safe. Eyes on the Prize — the landmark civil-rights documentary series — vanished from circulation for roughly a decade over expired music licenses; it took $850,000 in Ford and Gilder foundation grants in 2005 to begin renewing the rights, and re-licensing was estimated at over $500,000. Duke University Libraries' 2013 filing with the Copyright Office names a Jim Crow-era Black-life image collection as an orphan-works case. The corpus documents rights at record level throughout, but the synthesis-level finding deserves stating plainly: rights is arguably the top practical barrier to making Black collections accessible. It is the blocker that operates after every physical problem is solved, and it is the least funded to fix. A dedicated investigation into rights status and clearing pathways across the corpus is queued as follow-up work.

3.7 The memory chain: where abundance meets breakage

The ten-stage audit is the project's thesis in one table. Each stage was rated on the strength of the corpus evidence:

Stage	**Verdict**
1. Memory created	Strongest — the memory exists in abundance
2. Recorded	Second-strongest — broad documentation activity
3. Collected	Strong — many collections in private and institutional hands
4. Cataloged	**Worst-supported by hard evidence**
5. Preserved	Mixed — major rescues alongside active loss
6. Digitized	Patchy — in-person-only holdings, incomplete conversions
7. Connected	Second-thinnest — the project's rationale

Stage	Verdict
8. Discoverable	**Thinnest overall** — portal coverage partial, most holdings invisible to search
9. Used	Strong where discoverable — Shorefront's records fed reparations work; Freedmen's Bureau records feed genealogy
10. Transmitted	Strong — exhibitions, curricula, creator reuse

The shape is what the emergency means: abundance at the start, breakage in the middle. Black memory is created, recorded, and collected at scale. It then enters a middle passage — uncataloged, inconsistently preserved, patchily digitized, poorly connected, barely discoverable — where most of the loss documented in this paper occurs. What survives that passage is used and transmitted powerfully. The project is aimed at stages 7 and 8 because that is where the chain thins to a thread.

3.8 A triage framework: what to save first

Given scarcity, which at-risk collections should preservation action reach first? The framework answers with four observable factors, each with defined levels, combined through an explicit ordered rule set — no black-box score, no weighted index. A reader who disagrees with a tier can point to the exact factor rating and rule in dispute.

Risk severity rates the worst credible, documented threat: Critical (loss mechanism already triggered or due within about twelve months), High (credible threat within one to three years), Moderate (fragile custody, no active threat), Low (stable institutional custody). **Historical significance** must be evidenced, not asserted, from Exceptional (national recognition, sole documentation of a nationally significant subject, sustained scholarly corpus, or million-plus annual users) down to Low. **Uniqueness** runs from Sole copy — loss equals total erasure — through Scarce and Duplicated to Widely held. **Feasibility** gates everything: a collection the custodian refuses to release, or that is legally frozen, is Tier 4 document-and-monitor by Rule 0, full stop. Refusal is respected. Preservation without consent is not preservation; it is acquisition.

The combination rules run in order. Critical risk plus sole copy is Tier 1 (Emergency — act within twelve months) regardless of other factors. Critical risk plus exceptional significance is Tier 1. High risk plus high significance or scarce-or-better uniqueness is Tier 2 (Urgent — one to three years). Moderate risk with moderate significance or scarce-or-better uniqueness is Tier 3 (Planned — three-to-five-year pipeline). Everything else is Tier 4 (Monitor).

Eight worked examples demonstrate the mechanics. Tier 1: the surviving Oscar Micheaux film elements — Micheaux directed more than forty features between 1918 and 1948, the foundational Black independent cinema; roughly thirty titles are lost entirely and about ten survive, several as single incomplete prints on actively decomposing nitrate stock. Tier 2: BlackPast.org, the digital encyclopedia of African American history, whose founder Quintard Taylor died in 2025, leaving a donation-funded budget its own site says "cannot keep pace"; and the Obsidian Collection's Chicago Defender photo morgue — the visual record of the Great Migration — a small, founder-dependent nonprofit holding originals whose long-term storage conditions are undocumented. Tier 2, Provisional: Knoxville College's institutional records, on a campus closed since 2017 whose historic building burned in November 2024 — the records-specific threat is inferential and so labeled. Tier 3, Provisional on uniqueness: the Black Archives of Mid-America's eighteen-box Muhammad Speaks run. Tier 4, monitor: the DJ Screw Collection and Mother Bethel records — both rescued by documented action, both illustrating how a tier moves after intervention. Retrospective assessments of the JPC archive at its 2019 auction (Tier 1 then; Tier 4 now) and Mother Bethel at its 2013 move-or-lose point (Tier 2 then; Tier 4 now) show the same movement.

Two cautions travel with the framework. First, tiers are time-bound, not permanent: Tier 1 and 2 items are reassessed annually and on trigger events — fire, flood, a custodian's death, an auction announcement — and any assessment older than 24 months without review is marked Stale. Second, the retrospective examples illustrate tier movement; they predate the framework by thirteen to fifteen years and cannot validate it. The framework's claim is modest: that the next decision point can be found sooner, with the evidence on the table.

4. Limitations and gaps

Scholarship earns trust by naming what it cannot establish. This section records the project's limits, in the order of their weight.

The corpus is a map of the visible, and the visible is skewed. Thirty-three of the 84 collections are Chicago-based; the rest of the country is covered opportunistically. Roughly 62 percent of mapped collections sit with universities, major museums, public libraries, or federal institutions — a method-induced skew of web-visible sources. The community track is blunt about it: the most important collections are the ones no search can find. Community-controlled holdings are the known thin edge of this corpus, not the thin edge of Black memory itself. Fifty-four

collection records are honestly marked as not graded at record level rather than backfilled. Nothing in this paper should be read as a census.

The highest-value lead is unresolved. A.A. Rayner & Sons, the Chicago funeral home founded in 1947 that handled Emmett Till's funeral arrangements, has no discoverable archive, finding aid, or records-transfer announcement. Its business records would be first-order civil-rights evidence. The records may exist privately, may be lost, or may be held by the family; none of these can be verified without private inquiry, and the privacy constraint forbids initiating that inquiry intrusively. This is recorded as the single highest-value unresolved lead in the corpus — and as a lead that can only be resolved if the holders themselves choose to act, ideally through the funeral-records relationships the Bronzeville Historical Society already holds.

Custodianship unknowns cluster. The current (2026) status of the Obsidian Collection's digitization totals, preservation-grade storage, and backup posture is undocumented — the most time-sensitive verification gap in the project, since the framework's Tier 2 assessment of the Defender/Obsidian backlog may be understated or outdated in either direction. The morgue of Muhammad Speaks, the Nation of Islam's national paper and the largest-circulating Black newspaper of its day, has no located archive. The Vee-Jay Records masters and master book — more than 5,000 tapes — have no located repository after the 1966 bankruptcy, and commercial availability of the music does not imply preservation of the masters. The Chicago Whip morgue (1919–1939) surfaced no archive. Supreme Life's board minutes from 1953–1964 are cited in Cambridge scholarship, proving records existed and were accessible to at least one researcher, but the footnotes point to company-held minutes, not a public repository. Knoxville College's records custody is undocumented after the campus closure and the November 2024 fire; its Tier 2 assessment stays Provisional.

Whole classes of the unknown. There is no survey instrument for private and church archives as a class — family collections of Black Chicago history, church basements like Shorefront's — and privacy correctly limits what can be asked. Black-owned business records are systematically absent from public custodianship: Binga State Bank, Supreme Life, the Chicago Bee and Overton Hygienic, Vee-Jay, Chess (whose masters were destroyed in 2008) — corporate records become bankruptcy assets or simply vanish with the firm. Smaller BMRC-area repositories, church archives, neighborhood societies, and single-person operations were beyond the survey's reach. HBCU institutional records of closed and struggling colleges have no equivalent of the $5 million HBCU Radio Preservation Project covering 29 stations' broadcast archives.

Representation gaps inside the corpus. Of the 84 mapped collections, roughly two explicitly center Black women's organizational or community history. Church mother boards, women's clubs, sorority chapters, domestic-worker networks, and mutual-aid societies generated records the web-visible corpus barely captures — a representation gap, not a memory gap, and it needs a dedicated track. Working-class Black life appears mostly through burial records and employment-adjacent materials; the corpus over-represents institutions, professionals, and the celebrated.

Negative findings, not comfort. Two risk types returned no documented case in this pass: building demolition destroying records, and domain expiration. Both are recorded as explicit negative findings. Uncataloged materials destroyed in demolitions leave no paper trail — the absence is expected, not reassuring — and the exposure surface for domain loss (small archives, personal sites, no IT staff) is real and unmeasured. A future pass should test both directly: demolition-permit cross-referencing for the first, domain-registration monitoring for the second.

Measurement is thin. Pew's 18 percent tweet-decay figure is the only quantified decay rate in the corpus. There is no equivalent measurement for Black institutional websites, link rot in digitized collections, or platform-hosted archives. Digital decay in this domain is documented anecdotally and measured almost not at all.

The privacy–visibility tension is structural. Burial and funeral records, family collections, and living collectors' holdings were deliberately treated at aggregate level. That is correct, and it means this synthesis systematically under-describes the most humanly significant materials. Privacy protection and archival visibility are in tension, and privacy wins. Future work in these areas must be holder-led.

What stays Provisional. The reader should treat the following as labeled in the paper and not upgrade them: the AFRO archive's current processing state; the John Simmons garage-fire account; the disposition of the Carter and Black negative archives; Black Archives Co's self-reported reach; the 2014 Library of Congress acquisition of the HistoryMakers archive (single-source reporting); the Knoxville College records assessment; and the uniqueness rating of the Muhammad Speaks run at the Black Archives of Mid-America. Two claims about Universal Music vault-fire losses were graded Disputed after the company's public statements contradicted an internal loss memo. The corpus's 304 sources were accessed in late September 2026; web sources decay, and citations should be checked against live pages.
